

Lecture CW1: Differentiation and Optimization

Lecturer: Matthew Wicker

1 Course Work Specification

In our Lecture 3 and Lecture 4 we discussed optimization and differentiation. In this coursework you will be asked to implement various concepts we have discussed in python. You will also interact with and reason about the `autograd` package in the second part of this coursework assignment.

The exact assignment specifications/instructions are provided inside of the of the jupyter notebook that you all should have access to through LabTS.

Part 1 of this coursework is autograded. This notebook comes with embedded tests which will verify that your implementations provide outputs with the appropriate types and shapes required for our hidden tests. You can run these same public tests through **LabTS** when you have finished your work, to check that we get the same results when running these public tests. Hidden tests will be ran after the submission deadline, and cannot be accessed. They mostly check that you didn't cheat by using external functions, or that your implementations generate the correct answers for a few different (sensible) inputs.
